

Investing is a cinch

The coming months are likely to bring interesting opportunities for fixed income investors, as the longer-term prospects for fixed-interest assets continue to appear decent.

In a nutshell

- All precise interest rate forecasts should always come with hefty disclaimers.
- Rather than just focusing on when exactly the Fed will cut interest rates two, three, or four times (of 25 basis points each), there is a case to be made for taking a broad range of plausible rate paths as a given and remaining nimble.
- We expect 2024 to be a good year for fixed income generally, and corporate bonds in particular.

“The attention paid to short-term forecasting, and the delusion of control which it offers, diverts both resources and debate away from more important matters,” the economist Paul Ormerod wrote in his 1990s classic “Butterfly Economics,” adding: “Less can be more.”¹

With that in mind, we won’t bore you with too much detail in terms of the precise interest rate cutting path for coming months, not least as neither markets, nor central bankers themselves seem all that certain these days.² Doing so requires listing the precise short-term risk factors that might push each major central bank one way or the other at any given meeting, and if markets are currently uncertain, that’s generally because there are good arguments on both sides. For fixed income investors, what is instead key is the underlying, longer-term picture. On this, we see remarkably little change since our year-end outlook.

As we have long argued, inflation rates are coming down, but only gradually.³ The disinflation process is slowing, and setbacks are likely along the way. We expect an average headline inflation rate of 2.8% year over year for the U.S. and 2.5% year over year for the Eurozone in 2024. Regarding growth, we keep our expectation for the Eurozone virtually unchanged at 0.7%, as monetary policy is working and inflation rates have come down. For the

U.S., we have to adjust our growth path due to a robust carry-over from 2023 but hold on to a soft patch in the middle of 2024. We think that the U.S. economy will grow by 1.8% in 2024.

This might allow the European Central Bank (ECB) and the U.S. Federal Reserve (Fed) to start a gradual normalization process of policy rates by the mid-year. We see the Fed funds rate to be cut to 4.50% – 4.75% by March 2025, and the ECB deposit rate to 3%. We forecast that the Bank of Japan (BoJ) will probably hike the policy rate to +0.25% over the current 12 month forecasting horizon, until March 2025.

To be sure, all such forecasts –should always come with hefty disclaimers.⁴ For example, the outcome of the U.S. election is likely to play a major role for financial markets and will determine where many asset classes will trade in one year’s time. The range of plausible outcomes is wider than usual, not least as both major parties’ nominees are unusually unpopular.⁵ U.S. policymaking, moreover, will depend not just on which of the two elderly frontrunners – or someone else – wins the White House, nor even – arguably just as important and even trickier to forecast early on – how key Congressional races will play out. Instead, what any administration is likely to do will, as usual, critically depend on events leading up to election day and beyond.⁶

¹ Ormerod, P. (1998) “Butterfly Economics: A New General Theory of Economic and Social Behaviour”, Faber and Faber, p. 96. ² See, for example, Federal Reserve sparks market rally as officials stick to rate cut plan (ft.com), Financial Times, March 21, 2024; and Christine Lagarde says ECB will not commit to path of rate cuts (ft.com), Financial Times, March 20, 2024. ³ U.S. Economic Outlook (dws.com), DWS, as of July 23, 2023. ⁴ U.S. Economic Outlook (dws.com), DWS as of Jan. 17, 2024. ⁵ Tales of the unexpected (dws.com), DWS as of Feb. 25, 2024. ⁶ An early roadmap to U.S. politics in 2020 and beyond (dws.com), DWS, as of Jan. 24, 2020.

While we expect volatility to pick up in line with historical experience in the run up to the elections, many market projections are likely to be subject to revisions once a clearer picture emerges not just regarding the likely outcome, but how market participants interpret it. Quite often, political events are easier to forecast than investor reactions to surprises – just take the conventional wisdom in markets ahead of the 2016 U.S. presidential election.⁷

That said, we expect 2024 to be a good year for fixed income in general, and corporate bonds, as well as other spread priced fixed income assets, in particular. Despite all uncertainties, we remain convinced that central banks will cut policy rates – just not as quickly or as aggressively as some other market observers had assumed. For developed market sovereigns, such as Bunds and U.S.-Treasuries, we see the best risk-adjusted returns at the shorter to middle part of the maturity spectrum.

Note that currently, the yield curve is inverted as illustrated in the chart below using the yields on 10-year U.S.-Treasuries minus those on 2-year Treasuries. That means that for now, investors can earn higher interest by lending briefly or even just parking their money overnight rather than buying a longer-dated bond. Once rate cutting might start in the summer months, we expect current high money market fund balances to increasingly move into short duration sovereign debt. Falling inflation and moderating growth should thus be supportive for a steepening stemming from the front-end

of the curve. We expect Bund yields to hit 2.5% and 2.6% in March 2025 for 2- and 10-years respectively. For the U.S. we expect 3.95% and 4.20% for 2- and 10-years respectively.

Against this backdrop, we remain positive on Euro investment grade (IG) corporate bonds, where we expect to see further spread tightening to add to already high yield-to-maturity yields, also illustrated below. High quality covered bonds still look fine, even if the valuations are not that compelling following the recent swap spread tightening. Other investment opportunities we like include bonds with an ESG focus, such as common Next-Generation EU new issuance. Asset back securities should also benefit from short duration, inverted curve and strong credit performance. We expect emerging market (EM) sovereigns too to perform well, with spreads moving sideways. We generally favor euro-denominated IG rated EM bonds, over their U.S. dollar denominated higher risk peers, but caution that such investments need to be judged on a case-by-case basis.

Selection remains critical for all spread priced fixed income assets. For example, both dollar and Euro high yield (HY) corporate bonds have benefited from the enthusiastic mood in recent months, boosting risky assets of all sorts. Given higher refinancing costs, this could leave some HY issuers vulnerable to setbacks, whenever sentiment deteriorates. Whether to consider wider HY spreads as buying opportunities, though, in part remains on corporate fundamentals – though these mostly remain strong, detailed attention is required in

An inverted U.S. yield curve without a recession, at least so far

* yield resulting from 10-year minus 2-year U.S. Treasuries

⁷ See, for example, <https://www.cnbc.com/2016/11/01/what-happens-to-the-markets-if-donald-trump-wins.html>, as of Nov. 1, 2016 and The Real Story Of 2016 | FiveThirtyEight, as of Jan. 19, 2017

uncertain times issuer by issuer and bond by bond. On the plus side, it is worth keeping in mind that credit – unlike nominal sovereign bonds – can implicitly buffer some inflation, by boosting nominal revenues.

Which takes us full circular to the observation we started this piece with. “The economy at the aggregate level behaves much more like a purely random system than one that can be predicted and controlled,” as Ormerod put it in one of his other books.⁸ Take the seemingly common-sense idea that wage growth is necessarily inflationary and thus worrisome for central banks. Not necessarily, as we recently argued for the U.S., if it turned out to reflect lowly paid, young job switchers moving into potentially more productive jobs.⁹ Sometimes, potentially worrying developments such as continuing wage growth can instead hint at benign structural changes, upon closer inspection.

The fact remains that markets, investors and, yes, even central bankers, have a dismal record when making forecasts at the best of times, let alone the unusual ones we have been through in recent years. Rather than just focusing on whether and when exactly the Fed will cut interest rates two, three, or four times (of 25 basis points each), there is a case to be made for taking a broad range of plausible interest rate paths as given. Such an approach enables nimble investors to be ready to position themselves to secure decent returns against a wide range of these. “There is ample scope for strategy to fail at any point in time.” For this very reason, we are quite confident that markets will throw up interesting opportunities in the months to come.

Historically, yields look attractive, especially on U.S. investment grade bonds

Glossary

Asset-backed securities (ABS) are securities whose income payments, and thus value, is derived from and collateralized (or „backed“) by a specified pool of underlying assets.

The **Bank of Japan (BoJ)** is the central bank of Japan.

One **basis point** equals 1/100 of a percentage point.

Bunds is a commonly used term for bonds issued by the German federal government with a maturity of 10 years.

Covered bonds are securities similar to asset-backed securities (ABS) which are covered with public-sector or mortgages loans and remain on the issuer's balance sheet.

Duration is a measure expressed in years that adds and weights the time periods in which a bond returns cash to its holder. It is used to calculate a bond's sensitivity towards interest-rate changes.

Emerging markets (EM) are economies not yet fully developed in terms of, amongst others, market efficiency and liquidity.

Investors increasingly take **environmental, social and governance (ESG)** criteria into account when analyzing companies in order to identify non-financial risks and opportunities.

The **European Central Bank (ECB)** is the central bank for the Eurozone.

The **Eurozone** is formed of 19 European Union member states that have adopted the euro as their common currency and sole legal tender.

The **federal funds rate** is the interest rate, set by the Fed, at which banks lend money to each other, usually on an overnight basis.

Headline inflation is the raw inflation figure based on the consumer price index (CPI) and not adjusted for seasonality or for the often volatile elements of food and energy prices.

High-yield bonds are issued by below-investment-grade-rated issuers and usually offer a relatively high yield.

Inflation is the rate at which the general level of prices for goods and services is rising and, subsequently, purchasing power is falling.

Investment grade (IG) refers to a credit rating from a rating agency that indicates that a bond has a relatively low risk of default.

Monetary policy focuses on controlling the supply of money with the ulterior motive of price stability, reducing unemployment, boosting growth, etc. (depending on the central bank's mandate).

In economics, a **nominal** value is not adjusted for inflation; a real value is.

The **spread** is the difference between the quoted rates of return on two different investments, usually of different credit quality.

A **swap**, a type of derivative, is an agreement between two parties to exchange sequences of cash flows for a set period of time.

Treasuries are fixed-interest U.S. government debt securities with different maturities: Treasury bills (1 year maximum), Treasury notes (2 to 10 years), Treasury bonds (20 to 30 years) and Treasury Inflation Protected Securities (TIPS) (5, 10 and 30 years).

The **U.S. Federal Reserve**, often referred to as „the Fed,“ is the central bank of the United States.

Volatility is the degree of variation of a trading-price series over time. It can be used as a measure of an asset's risk.

A **yield curve** shows the annualized yields of fixed-income securities across different contract periods as a curve. When it is inverted, bonds with longer maturities have lower yields than those with shorter maturities.

A **yield-curve inversion** is when the yields on bonds with shorter duration are higher than the yields on bonds that have a longer duration.
